

*"Unlock your dream career with us. Connect with renowned employers, enjoy top-notch facilities, and thrive in a vibrant community."*

**Employer:** D.Hive

**Position:** Full-Stack Software Engineer (Cloud Platform)

**Years of Experience:** 5-10 years

**Community Location:** Hybrid (Noida/Pune)

**Employment Type:** Full-Time

**Work Days:** 5 days

## CONNECT

### Company Overview

McKinley Rice is not just a company; it's a dynamic community, the next evolutionary step in professional development. Spiritually, we're a hub where individuals and companies converge to unleash their full potential. Organizationally, we are a conglomerate composed of various entities, each contributing to the larger narrative of global excellence.

### Redrob by McKinley Rice: Redefining Prospecting in the Modern Sales Era

Backed by a \$14 million Series A funding from leading Korean & US VCs, **Redrob** is building the next frontier in **global outbound sales**. We're not just another database—we're a platform designed to eliminate the chaos of traditional prospecting. In a world where sales leaders chase meetings and deals through outdated CRMs, fragmented tools, and costly lead-gen platforms, Redrob provides a unified solution that brings everything under one roof.

Inspired by the breakthroughs of Salesforce, LinkedIn, and HubSpot, we're creating a future where **anyone, not just enterprise giants, can access real-time, high-quality data on 700 M+ decision-makers, all in just a few clicks.**

At Redrob, we believe the way businesses find and engage prospects is broken. Sales teams deserve better than recycled data, clunky workflows, and opaque credit-based systems. That's why we've built a seamless engine for:

- ❖ **Precision prospecting**
- ❖ **Intent-based targeting**
- ❖ **Data enrichment from 16+ premium sources**
- ❖ **AI-driven workflows to book more meetings, faster**

We're not just streamlining outbound—we're making it smarter, scalable, and accessible. Whether you're an ambitious startup or a scaled SaaS company, **Redrob is your growth copilot for unlocking warm conversations with the right people, globally.**

### How to become a part of our community:

- ❖ **Step 1:** HR Screening (Virtual)
- ❖ **Step 2:** Technical Interviews (2 Rounds | Virtual)
- ❖ **Step 3:** Be a part of the team at **McKinley Rice!**

### Employer (D.Hive) Overview

D.Hive provides site-specific autonomous driving SaaS solutions using its autonomous robot platform, ROBOPILOT.

ROBOPILOT enables faster, easier, and safer deployment of robots regardless of model type. Through the ROBOPILOT software platform, customers can implement site-customized robot services using quadruped or wheeled robots and drones.

Commercialization Example: Construction Sites – D.Hive is currently collaborating with Hyundai Construction. This year, D.Hive plans to verify safety monitoring functions, such as helmet and safety harness detection, using drones and quadruped robots.

### Project Description

This project focuses on developing a robot/drone control service that utilizes D.Hive's own robots and drones for safety monitoring purposes.

The goal is to provide services to multiple clients, enabling client-specific, region-specific, and robot-specific control, along with AI-based real-time recognition and recording of video feeds transmitted from robots. The stored data should be retrievable by client, site, or robot for later review.

### Role Overview

D.Hive is looking for a Full-Stack Software Engineer to contribute to the development of cloud-based POC services for its robot and drone control platform. In this role, you will work across the full technology stack to build services that manage and process real-time video feeds transmitted from multiple sources, including robots, drones, CCTV systems, and other video-based services. You will contribute to real-time video transmission, playback, AI-based video recognition, cloud data management, and client- and device-specific service management.

The ideal candidate will have hands-on experience working on video streaming projects, particularly those involving multi-source video environments. The depth of video-streaming experience is less important than having directly worked on relevant projects and understanding the practical challenges involved in transmitting, processing, storing, and replaying video data.

We particularly value candidates who have spent 2–4+ years with a company or team, demonstrating steady growth and the ability to take on progressively broader technical responsibilities across different areas of software development.

### Key Responsibilities:

- Design, develop, and maintain full-stack cloud services supporting D.Hive's robot and drone control platform.
- Develop services for real-time video transmission, streaming, playback, recording, and retrieval across multiple video sources.
- Work with video feeds from sources such as robots, drones, CCTV systems, video-chat services, and other multi-source video environments.
- Implement and optimize video-streaming solutions using technologies such as RTMP and WebRTC.
- Develop backend services and APIs for client-specific, region-specific, and robot-specific control and data management.

- Build cloud-based data management solutions for storing and retrieving video and related operational data.
- Develop AI-based video recognition and processing workflows using machine learning and Python.
- Build responsive and intuitive front-end applications using React.js for monitoring, control, visualization, and video playback.
- Develop systems for managing users, clients, robot devices, and associated operational data.
- Implement real-time communication and messaging using technologies such as MQTT and Socket.IO.
- Develop visualization and replay capabilities for stored video, GPS, and LiDAR sensor data.
- Work with AWS and Docker to develop, deploy, and manage scalable cloud-based services.
- Collaborate with the broader engineering team to troubleshoot technical challenges and continuously improve system performance, reliability, and scalability.

### Basic Requirements

- Proven experience as a Full-Stack Software Engineer with hands-on experience developing and delivering production or POC-level applications.
- Hands-on experience with video streaming projects is mandatory, particularly experience involving multiple video sources such as CCTV, robotics, drones, video-chat services, or similar real-time video environments.
- Practical understanding of video-streaming technologies such as RTMP and WebRTC.
- Strong experience with React.js for front-end application development.
- Experience with Python and Machine Learning/Vision AI for video or image-based applications.
- Experience with databases such as DynamoDB or PostgreSQL.
- Experience with real-time messaging and communication technologies such as MQTT and Socket.IO.
- Practical experience working with AWS cloud services.
- Experience with Docker and containerized application development.
- Ability to work across front-end, backend, cloud, database, and real-time communication components of a software solution.
- Strong problem-solving ability and the ability to understand and work across different technical areas of a complex product.
- Candidates who have demonstrated 2–4+ years of progressive growth within a single company or team are preferred, particularly where they have expanded their responsibilities across multiple technical domains.

### Preferred Skills

- Experience with backend technologies such as PHP, Laravel, or FastAPI.
- Experience developing AI, robotics, autonomous systems, or computer-vision-related services.
- Experience working with WebApp development, C++, or Figma.
- Experience designing or contributing to cloud-service full-stack architecture.
- Familiarity with cloud security, fleet/device management, or robot fleet management systems.
- Experience with UI/UX design or close collaboration with UI/UX teams.
- Exposure to LLM-based applications or technologies.
- Experience working on systems involving real-time sensor data such as video, GPS, or LiDAR.
- Experience working in environments where multiple technical components need to be integrated into a single cloud-based platform.
